

Model View Controller (MVC)

Model:

- Represents the data model
- Manages data's states
- Includes Business Logic of our application
- Often used across different parts of our application

View

- Essentially it is our layout and views
- The way we represent data on screen
- Renders the user interface

Controller

- Essentially, it is our activities and fragments
- Includes user's interaction with our app
- Communication channel between our views and models
